

My original proposal described a two-stage quiz: broad multiple-choice questions to narrow down categories, followed by "this or that" for head-to-head comparisons until the user landed on their top picks, with restaurant recommendations from the Google Places API at the end. What I built keeps the same core idea (a multi-stage quiz that narrows down what you're craving and finds it nearby) but I replaced the "this or that" elimination stage with three progressively more specific multiple-choice pages (sweet or savory → type of dish → cuisine). I made this change to keep the project focused and manageable in the time I had, since the elimination bracket added a lot of state-tracking complexity for a similar end result. Along the way I learned how to use Flask routes and the session to move a user through several pages and carry their answers between them, and how to call the Google Places API and handle cases where it returns nothing or fails.
